Personal Statement

.NET Developer with four years of experience building web applications. I specialise in real-time ASP.NET Core and Blazor systems (SignalR, multi-tenant dispatch) and in AI automation that checks LLM output rather than trusting it. I also run my own Linux infrastructure and build side projects end to end.

Technical Skills

- **Back-End:** .NET, C#, ASP.NET Core, MVC, Blazor, EF Core, SignalR, Hangfire, REST APIs
- **Front-End:** HTML, CSS, JavaScript, TypeScript, React, Next.js
- **Databases:** MS SQL Server, PostgreSQL, T-SQL
- **AI:** Semantic Kernel, Autogen
- **Infrastructure & Tools:** Linux, Docker, Caddy, Tailscale, Railway, Git, GitHub Actions, PowerShell, Visual Studio, JetBrains IDEs

Professional Experience

.NET Developer | Central Technology Ltd | Remote (Chesterfield-based company) | Feb 2025 – Present

- Build real-time, multi-tenant dispatch features in ASP.NET Core, SignalR and EF Core.
- Engineered data-driven wallboard web apps and a reusable framework that lets new branches have boards created from scratch in ~20 minutes via SQL and SignalR.
- Built AI automation with Semantic Kernel inside an agent architecture based on vertical slicing and shared context files.
- Improved database performance through more efficient SQL queries and EF Core refactoring.

Junior .NET Developer | Central Technology Ltd | Remote (Chesterfield-based company) | Oct 2022 – Feb 2025

- Built features for internal and customer-facing applications using ASP.NET Core, C#, Blazor, MVC, JavaScript and Hangfire.
- Wrote and maintained SQL scripts and bespoke reports for recurring operational issues and data forensics, turning manual investigation into repeatable tooling.
- Created PowerShell components and monitoring scripts via an RMM platform to automate routine checks on client devices.

Projects

Meducate API | meducateapi.com — .NET 10, Blazor Server, PostgreSQL, Semantic Kernel, Hangfire, Railway

- Live REST API serving structured data on 2,000+ health topics from MedlinePlus and PubMed, refreshed daily by Hangfire jobs, with magic-link sign-in, API keys and tiered rate limiting.
- LLM classification into 24 categories, followed by a QC step that screens for hallucinations before anything is saved. About 88% of diagnosable topics carry a verified WHO ICD-11 code.

Wayfarer | wayfarer.wjleece.dev — React, TypeScript, Node.js, Wikidata SPARQL, Docker

- Natural-language-to-map app grounded in Wikidata: an agent builds and tests SPARQL at query time, and an independent verification pass checks the results before they reach the map.
- Supports Anthropic and OpenAI models with user-supplied keys, plus a 24-hour result cache.

Self-hosted infrastructure

- Run a Linux VPS behind a Caddy reverse proxy, linked to a home server over a Tailscale private network, with uptime monitoring.

Education

BTEC Level 3 in Computer Science, Chesterfield College | Chesterfield, UK
