Personal Statement

.NET Developer with four years of experience. I build ASP.NET Core and Blazor web apps, from real-time SignalR wallboards to multi-tenant client portals, and I specialise in production AI features that are checked independently, using models I have benchmarked first. I also run my own Linux servers and ship side projects.

Technical Skills

- **Back-End:** .NET, C#, ASP.NET Core, MVC, Blazor, EF Core, SignalR, Hangfire, REST APIs
- **Front-End:** HTML, CSS, JavaScript, TypeScript, React, Next.js
- **Databases:** MS SQL Server, PostgreSQL, T-SQL
- **AI:** Microsoft Agent Framework, Codex, Claude, LLM benchmarking and evaluation
- **Infrastructure & Tools:** Linux, Docker, Caddy, Tailscale, Railway, xUnit, Git, GitHub Actions, PowerShell, Visual Studio, JetBrains IDEs

Professional Experience

.NET Developer | Central Technology Ltd | Remote (Chesterfield-based company) | Feb 2025 to Present

- Build production AI features with Microsoft Agent Framework across a range of use cases, from chat interfaces to recommendation generators.
- Set up AI-assisted development workflows in Codex and Claude, using optimised instruction files, execution plans and git worktrees. Running two to three workstreams in parallel at least doubles my throughput.
- Built an AI benchmarking suite, packaged as a Codex skill, that compares any model available in Codex on a common task, and tests instruction files per model per task to find the best model and instruction file for each job.
- Built SignalR wallboards and a reusable framework that gets a new branch its boards in about 20 minutes.
- Build features for a multi-tenant client portal in ASP.NET Core, Blazor and EF Core, where customers view their own data and submit requests.
- Optimised many slow reports and queries, some from minutes to seconds, using parameterised OPENQUERY, subquery filtering and EF Core refactoring.

Junior .NET Developer | Central Technology Ltd | Remote (Chesterfield-based company) | Oct 2022 to Feb 2025

- Built features for internal and customer-facing applications using ASP.NET Core, C#, Blazor, MVC, JavaScript and Hangfire.
- Wrote and maintained SQL scripts and bespoke reports for recurring operational issues and data forensics, so manual investigations became repeatable.
- Automated routine device checks with PowerShell via an RMM platform.

Projects

Meducate API | meducateapi.com | .NET 10, Blazor Server, PostgreSQL, Hangfire, Railway

- Live REST API covering 2,000+ health topics from MedlinePlus and PubMed. Hangfire jobs refresh the data daily, and access is by magic-link sign-in and API key with tiered rate limits.
- An LLM sorts each topic into one of 26 categories, then a QC step screens for hallucinations before anything is saved. About 88% of diagnosable topics carry a verified WHO ICD-11 code.
- xUnit test suite, with GitHub Actions CI that builds and tests every push and CodeQL scanning.

Wayfarer | wayfarer.wjleece.dev | React, TypeScript, Node.js, Wikidata SPARQL, Docker

- Turns a plain-English query into a map, with Wikidata as the source of truth. An agent writes and tests the SPARQL at query time, and a separate verification pass checks the results before they reach the map.
- Users bring their own Anthropic or OpenAI key, and repeat queries come from a 24-hour cache.

Self-hosted infrastructure

- Run a Linux VPS with Caddy as the reverse proxy, a Tailscale link to my home server, and uptime monitoring.

Education

BTEC Level 3 in Computer Science, Chesterfield College | Chesterfield, UK
